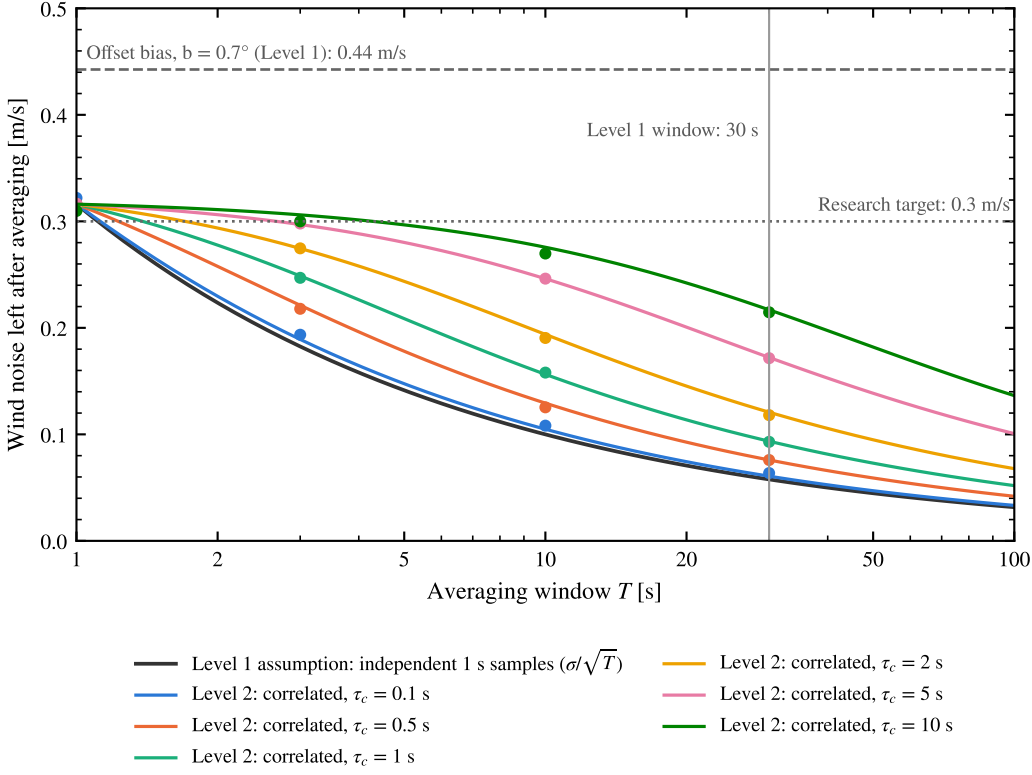
Correlated tilt noise: Level 1's n_eff = 30 needs errors that fade within ~0.1 s, but the noise stays below the offset bias for any correlation time



Hattenberger (measured) at V = 5 m/s (0.63 m/s per degree). Tilt noise 0.5° per 1 s sample held fixed (D4); Gauss-Markov correlation time τ_c (A12). Curves: exact variance of a T-second mean. Dots: Monte Carlo, 400 windows of the longest T, seed 0. Offset bias to first order (sensitivity × b).
